Acknowledgements

The Aurangabad Cancer Registry Division of the Mumbai Cancer Registry became operative in January, 1978 as a collaborative effort with Aurangabad Medical College. The staff members of the department of the Radiotherapy at the Medical College were entrusted with day-to-day work relating to the registry.

In this publication Cancer Incidence and Mortality in the Aurangabad City Agglomeration data has been thoroughly analyzed by sex, site, age, method of diagnosis, language, education and histology, and is based on all new cancer cases diagnosed in the resident population of Aurangabad City Agglomeration during the 6 year period, 1st January 2010 to 31st December 2015.

The major bulk of the cancer cases registered are abstracted from Aurangabad Medical College and Seth Nandlal Dhoot Hospital. The registry staff is also grateful to the various hospital administrators, their staff members and medical specialist in private practitioners, who have co-operated with us by permitting our Social Investigator to collect the data on cancer patients in their care. We are indebted to the Dean of Aurangabad Medical College, Aurangabad for providing adequate office space for our registry.

Staff of Aurangabad Cancer Registry

Mr. Ashok Maruti Waghmare, M.A

Medical Social Investigator

Historical Background

The Mumbai Cancer Registry was established in June 1963 as a unit of the Indian Cancer Society, at Mumbai, with the aim of obtaining reliable morbidity data on cancer, from a precisely defined urban population (Greater Mumbai). The actual compilation of data could however only begin in 1964. Until then, no continuing surveys had ever been undertaken anywhere in India. Initially, up to 1975, the project was initiated in collaboration with and with financial support from the Biometry branch of the National Cancer Institute of the Department of Health in Bethesda, U.S.A. During 1975-80 the project received grants from the Department of Science and Technology of the Government of India at New Delhi and from the Indian Cancer Society. Since September 1981, the Indian Council of Medical Research, at New Delhi, has initially supported the project.

In order to identify the etiological factors that might be implicated in a segment of a selected population, it is necessary to determine the behavior patterns, habits, customs and environment background, of the group under study. It is also essential, to identify the differences if any, in the site patterns and incidence rates of the disease, amongst various communities living in geographical areas having different patterns of climate and physical environment and dietary habits and social customs, which are known to vary.

With this aim in mind, satellite cancer registries were established in population zones of different sizes, in Maharashtra State, so that the cancer problem throughout the state could be investigated in depth, in the light of the experience gained from the Bombay Metropolitan Registry. Thus the first satellite registry was established in Poona City in 1972, the Second at Aurangabad in 1978 and the third at Nagpur in 1980

Demographic Characteristics of Aurangabad City

Aurangabad city is the head quarters of Marathwada, a geographic division of Maharashtra. Marathwada it covers an area of 50.48 sq.kms. having a population of 12,76,482 (2011 Census). Population density in 2011 is 17300 per sq.km. and the area supports a multi religious groups.

A city receives about 800 mms of rainfall annually. A look at the maximum 42.4°C and minimum 8.4°C temperatures reveals that considerable variations occur in the weather during the year. Aurangabad agglomeration comprises Aurangabad city and cantonment area. Aurangabad city receives the water supply from Jaikwadi dam.

Aurangabad is an important industrial town as well as popular conference center. The fastest growing industrial region in Asia, leaders in industry like Videocon, Siemens and Bajaj have units within its periphery. The city is convenient base for organizing visits to the world famous RockFort temples of Ajanta and Elora. Besides, the presence of Buddhist caves in the vicinity shows that the region enjoyed celebrity status as early as the seventh century.

Named after Aurangazeb, last of the six great Moghul, emperors and his son, Azam Shah, who built a Mausoleum here for his father's wife, Rabia Durani. Aurangabad lies almost in the center of Maharashtra.

Sources of Information

The main source of our data collection is Aurangabad Government Medical College and Dhoot Radiotherapy Center. At present Aurangabad city has 2 medical colleges. The city has 12 hospitals and 51 Nursing homes providing 507 seven beds. Besides this private nursing home there are facilities available for diagnosis and treatment of all cancer cases as city has specialists practicing neurology, neurosurgery, medical oncologists, histopathologists and cardio-vascular surgeons in the public as well as private sector institutes.

Population Estimates

Population data was estimated from the 2001 and 2011 census reports. The estimates as on 1st January 2011 were obtained by assuming a geometric rate of growth for each age group and sex. Population distribution by age and sex for Aurangabad City Agglomeration as on 1st July 2013 is shown in the age pyramid and given in Table 1. The estimated population of the Aurangabad City Agglomeration as on 1st July 2013 (The mid point of the period , 2010 –2015) is 12.76 Lakhs (6.60 Lakhs Males and 6.16 Lakhs Females).

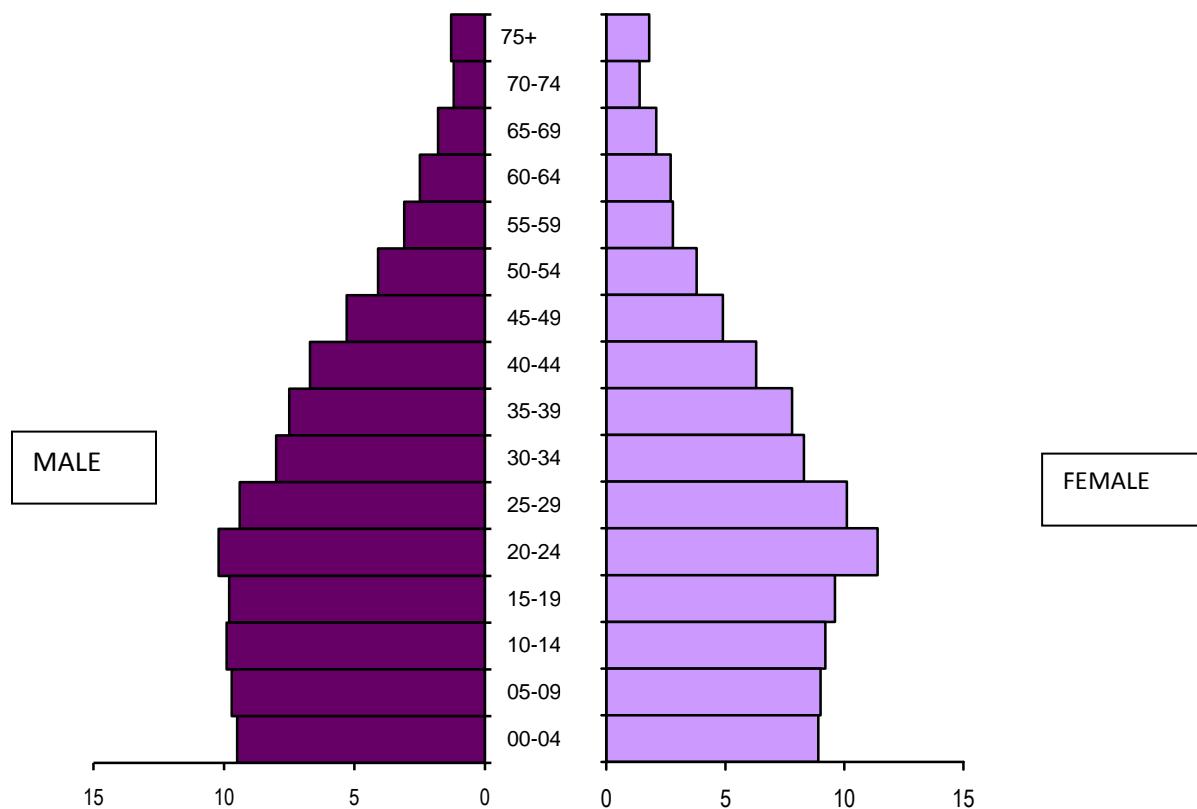

Fig. 1: Percentage Distribution of Estimated Resident Population of Aurangabad City As on 1st July 2013.

Cancer Registration System

Population based cancer registration is a procedure evolved to obtain detailed information on all persons affected by the disease who are resident within a precisely define geographical area, which can be pooled and analyzed at a centralized repository. Such a registry differs in many ways from survey, wherein similar information is obtained only as a spot check, during a selected period of time, which can thus reveal only the prevalence of a disease at a given time. The collection of factual information on the other hand is a continuous process in a registry setup, where efforts are made to obtain the necessary information, as soon as possible after diagnosis has been made.

During the period 2010-2015, information was obtained from all cancer patients registered in hospitals, under the care of consultants, physicians, surgeons, gynecologists and radiologist in Aurangabad city and from Aurangabad residents under treatment at the Tata Memorial and other leading hospitals in nearby Mumbai City. General medical practitioners are not contacted individually, because according to local practice only medical specialists treat cancer patients in hospitals and nursing homes and even those patients not admitted for hospital care are at one stage or the other referred to such specialists by the general parishioners.

Working of the Registry

Staff members personally visit the wards of the co-operating hospitals regularly; to interview all confirmed cancer patients and also those who are under cancer registration. The record files maintained by the various departments of these hospitals viz. Pathology, Hematology, Radiology and the various registers in the specialized surgical and medical wards are also examined.

The requisite details obtained for each patients, are cross-checked with the information collected from the various departments of the collaborating hospitals, to ensure completeness of records. Full information on every cancer patient registered at each and every hospital is thus obtained, irrespective of whether or not the patient is subsequently treated at the particular hospital. Additional information is obtained every time a cancer patient is re-admitted or re-examined at the institution.

As a result of such data collection from different hospitals, one and the same patients are sometimes found to be registered at two or more hospitals. Care is taken, to see that multiple entries for the same patient are not made in our records. On the other hand in some instances complete medical information is obtained by combining the data obtained from two or more hospitals, of one and the same patient.

Only patients residing in Aurangabad City Agglomerations are included in the registry so that the information collected could be related to a known population at risk. Non-residents, whose residence can not be specifically confirmed are also not included in the study.

Cancer Incidence Reporting System

Cancer incidence is defined as the occurrence of new cancer cases in a define population during a specified time period. In this report, the incidence is based on those cancers registered and which were first diagnosed between 1st January 2010 and 31st December 2015 from residents of Aurangabad City Agglomeration.

All malignant tumours including those where the pathologist may have merely suspected a malignant change are registered. Cases under code 'O' (benign) or '1' (uncertain whether benign or malignant borderline malignancy) or '2' (Carcinoma in situ) are not included in our files. Patients in whom cancer has been ruled out or has not yet been diagnosed are also omitted from our register.

We utilize the coding system devised by the World Health Organization using code numbers C00-C96 as published in the Manual of the International Classification of Diseases, Injuries and Causes of Death -10 the Revision (WHO-1992)

For histology coding the World Health Organization's in 2000 edition of International Classification of Diseases for Oncology (ICD-O3) giving histogenic and malignancy codes is followed, in conjunction with the primary site codes suggested by the World Health Organization.

Results

During the period under review (2010-2015), 4190 new cancer cases were registered among the residents of Aurangabad City Agglomeration, which given an average of 698 new cases per annum. Of these 4190 new cases, 2053 were males and 2137 were females indicating an M/F sex ratio of 0.96:1.0 where as the M/F sex ratio in general population viz 1.07:1.0. The number of cases by major sites, sex and year are given Table 2 & 3 for males and females respectively.

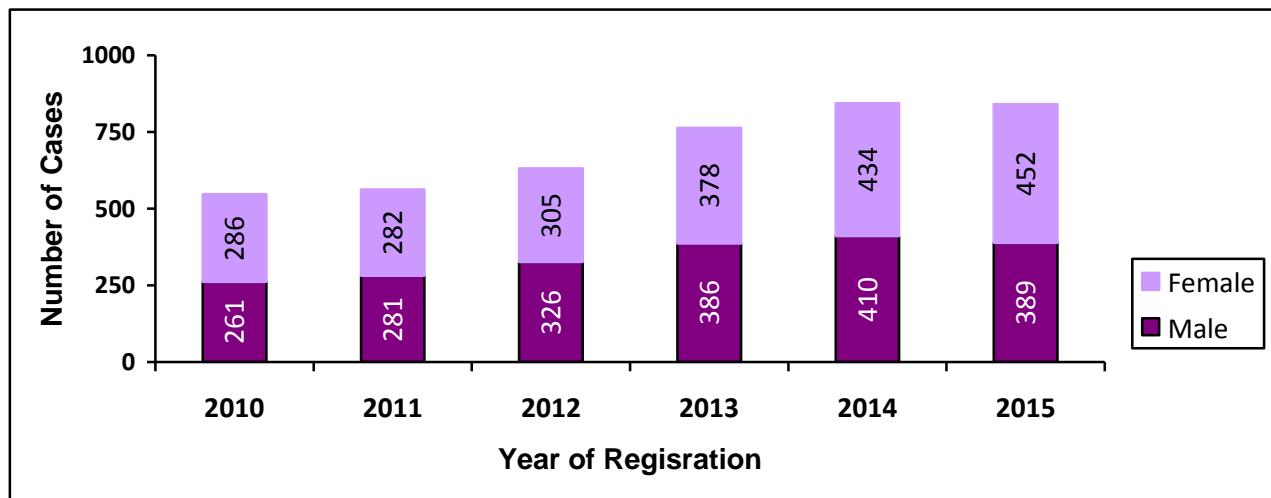

Fig. 2 : Number of Incidence Cases of Cancer By Sex and Year of Registration

Site

The number of new cases by site group and sex for period 2010-2015 are given in Table A. In males, Buccal cavity & Pharynx is found to be the most commonest cancer site group followed by Digestive Organs and Respiratory Organs. In females, genital organs and breast contributes more than 50% of total female cancer cases.

Table A: Number of New Cancer Cases by Site group and Sex with Percentage Distribution, Aurangabad, 2010-2015.

Site	Male		Female		Total	
	N	%	N	%	N	%
Head & Neck	768	37.4	217	10.2	985	23.5
Digestive Organs	388	18.9	220	10.3	608	14.5
Lung	211	10.3	82	3.8	293	7
Bone & Soft Tissue	49	2.4	35	1.6	84	2
Skin, Melanoma & Others	35	1.7	28	1.3	63	1.5
Breast	16	0.8	674	31.5	690	16.5

Lymphoma	93	4.5	66	3.1	159	3.8
Multiple Myeloma	25	1.2	6	0.3	31	0.7
Leukemia	124	6.0	73	3.4	197	4.7
Unknown and secondaries, Illdefined	103	5.0	57	2.7	160	3.8
Total	2053	100	2137	100	4190	100

Age

The number of new cancer cases by site and age are presented in Tables 4 & 5 for the period 2010-2015, for males and females respectively. Percentage Distribution of the Residence Population as on 1st July 2013 and Average Percentage distribution of New Cancer Cases for the period 2010-2015 by Age and Sex is presented in Table B.

Table B: Percentage Distribution of the Residence Population as on 1st July 2013 and Average Percentage distribution of New Cancer Cases for the period 2010-2015 By Age and Sex.

Age Group	Population			New Cancer Cases		
	Male	Female	Total	Male	Female	Total
00-14	29.1	27.1	28.1	4.4	2.3	3.4
15-34	37.4	39.4	38.4	12.1	10.8	11.4
35-64	29.1	28.2	28.7	55.5	64.1	59.9
65+	4.4	5.3	4.8	28.0	22.8	25.3
Total	100.0	100.0	100.0	100.0	100.0	100.0

The Table B clearly indicates that cancer occurs mostly at older ages as only 3.4% of the total number of cancer cases registered, were under 15 years of age, although this age group account 28.1 % of the total population. The association of cancer with the aging process is clearly shown by the fact that 25.3% of the cases are diagnosed at age 65 and above, an age group which comprises only 4.8% of the population. (Table B & Fig. 3)

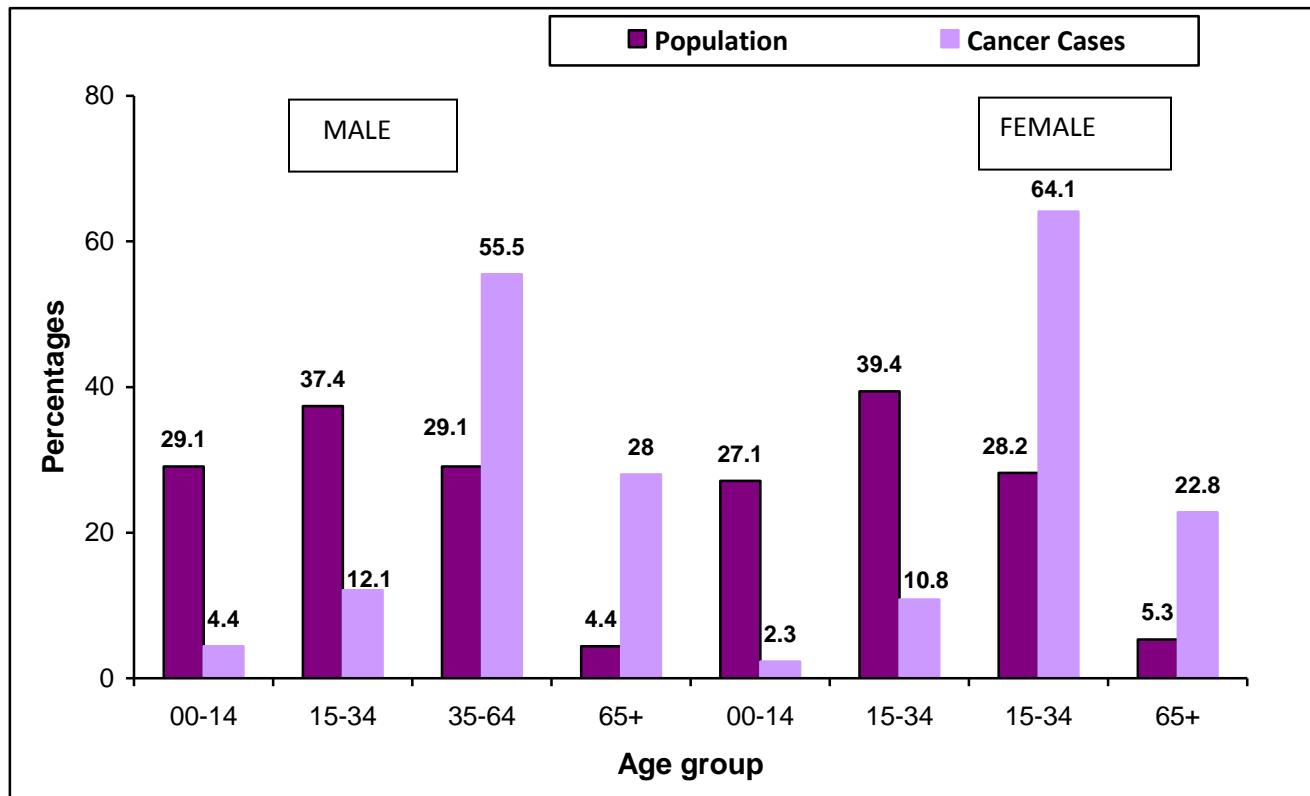

Fig. 3: Percentage Distribution of Resident Population and Cancer Cases, 2010-2015.

Crude, Age Specific, Age Adjusted and Truncated incidence rates by sites are given in Table 6 & 7 for males and females respectively. By relating the new cancer cases to the estimated population of Aurangabad City Agglomeration as on 1st January 2010 to 31st December 2015, we find that a crude cancer incidence rate of 54.6 per 100,000 population, for the period 2010-2015. The crude cancer incidence rate for females (57.8) was thus found to be higher than that of for males (51.8).

Age Specific incidence rate per 100,000 Population for all cancer sites for the period 2010-2015 are presented in Table C and Fig.4.

Table C: Age Specific Incidence Rates Per 100,000 for All Cancer Sites, by Sex, 2010-2015

Age-Group	Male	Female
00-04	7.9	3.3
05-09	8.1	6.6
10-14	7.7	5.0
15-19	9.3	5.1
20-24	9.1	10.2
25-29	14.8	15.3
30-34	38.1	36.6
35-39	43.5	54.6
40-44	64.0	96.0
45-49	91.2	144.6
50-54	136.8	166.9
55-59	177.1	227.9
60-64	216.4	254.5
65-69	367.1	315.3
70-74	336.0	280.9
75+	283.0	144.4
Total	51.8	57.8

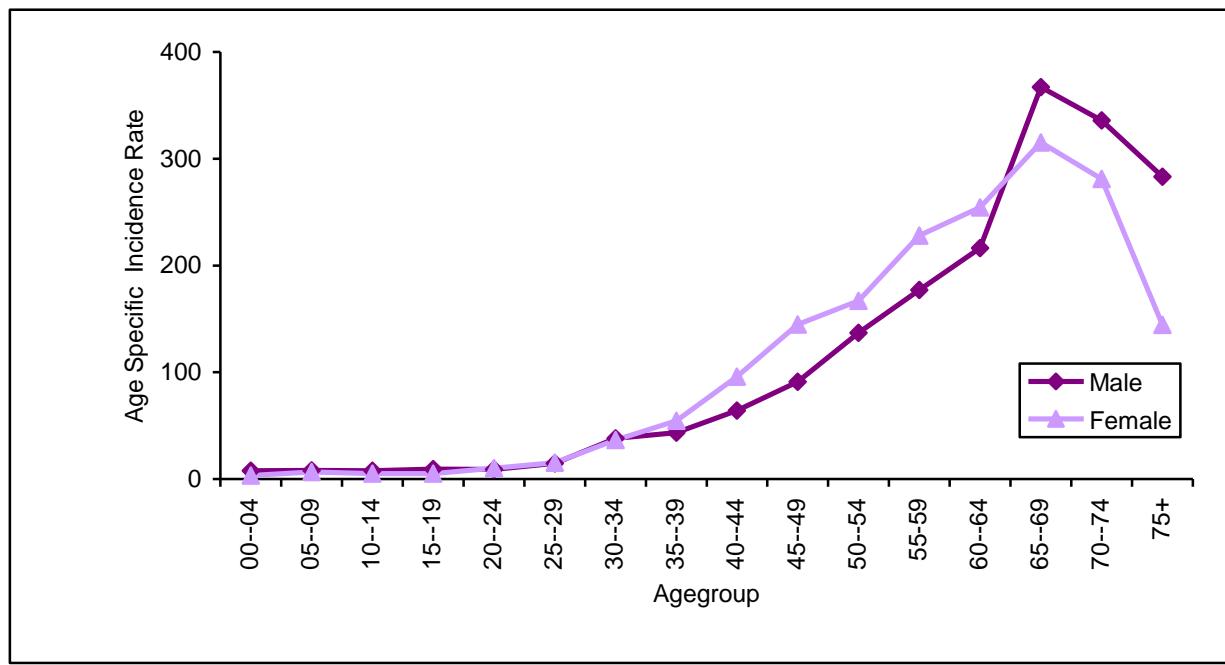

Fig. 4: Age Specific Incidence Rates per 100,000 Population for all Cancer Sites, 2010-2015

Since the incidence of cancer is known to increase with age, comparison of the rates between different populations should take into consideration by age composition of each group. The commonly accepted method of minimizing the difference in age distribution of the incidence rates is to base the rates to be compared on a common age distribution.

Cancer incidence rates adjusted to the age distribution of the population of the World taken as a whole indicates that the incidence of cancers in men at 65.4 is somewhat similar in woman at 69.5. The most common sites of cancers in males and females are shown in Table D and Figure 4. The most common site of cancer in male were Mouth. Cancer of the Lung and Tongue occupied second and third ranks. Cancer of the genital organs were found to be predominate in females, the Breast being leading site with the Uterine-Cervix coming second in rank. The Ovary was the third leading site in women.

Table D: Annual Age-Adjusted Incidence Rates by Sex per 100,000 Population at Ten Leading Sites and at all Sites, 2010-2015, Aurangabad.

Male			Female		
No	Site	AAR	No	Site	AAR
1	Mouth	8.0	1	Breast	21.9
2	Lung	7.4	2	Cervix	13.6
3	Tongue	5.3	3	Ovary	3.9
4	Oesophagus	5.3	4	Oesophagus	2.7
5	Larynx	4.2	5	Lung	2.7
6	Leukemia	3.5	6	Mouth	2.2
7	Lymphoma	2.7	7	Leukemia	2.1
8	Hypopharynx	2.6	8	Tongue	2.0
9	Rectum	2.6	9	Lymphoma	2.0
10	Prostate	2.0	10	Corpus Uteri	1.9
AAR At all Sites		65.4	AAR at all Sites		69.5

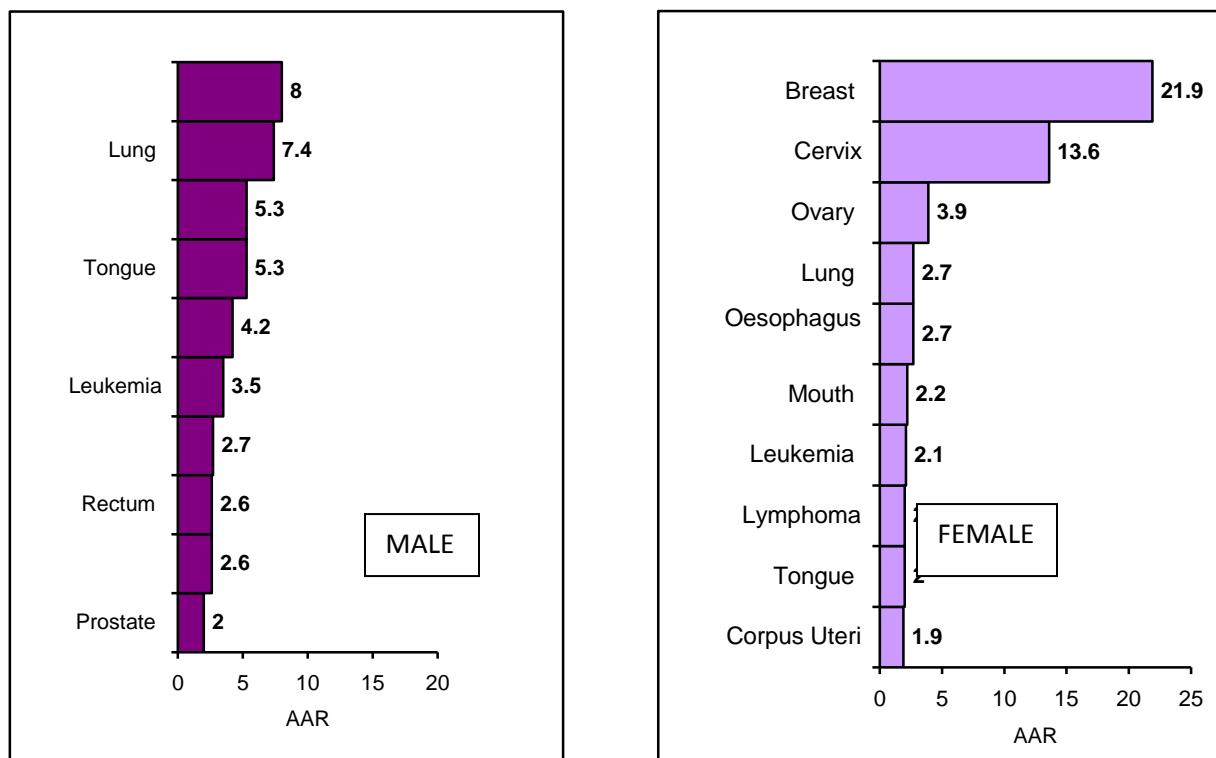

Fig.5: Age Adjusted Incidence Rates per 100,000 Population at Ten Leading Sites, 2010-2015, Aurangabad

Table E: The Leading Cancer Sites by Truncated Incidence Rates by Sex, Site, 2010-2015, Aurangabad.

Male			Female		
No	Site	TCR	No	Site	TCR
1	Mouth	16.9	1	Breast	52.8
2	Tongue	11.7	2	Cervix	29.5
3	Lung	11.0	3	Ovary	9.3
4	Larynx	8.9	4	Lung	4.9
5	Oesophagus	8.8	5	Mouth	4.9
6	Rectum	4.8	6	Corpus Uteri	4.5
7	Hypopharynx	4.3	7	Oesophagus	4.2
8	Lymphoma	4.1	8	Tongue	4.1
9	Stomach	4.0	9	Lymphoma	3.1
10	Urinary Bladder	3.5	10	Stomach	2.7
TCR at all Sites		111.3	TCR at all Sites		146.3

Age reporting was found to be more reliable in the age group 35 to 64. The truncated incidence rates between the ages 35 to 64 adjusted to the age distribution of the World Population are presented in Table E, where ten leading cancer sites ranked as per truncated rates for males and females during 2010-2015, are given in Fig.6.

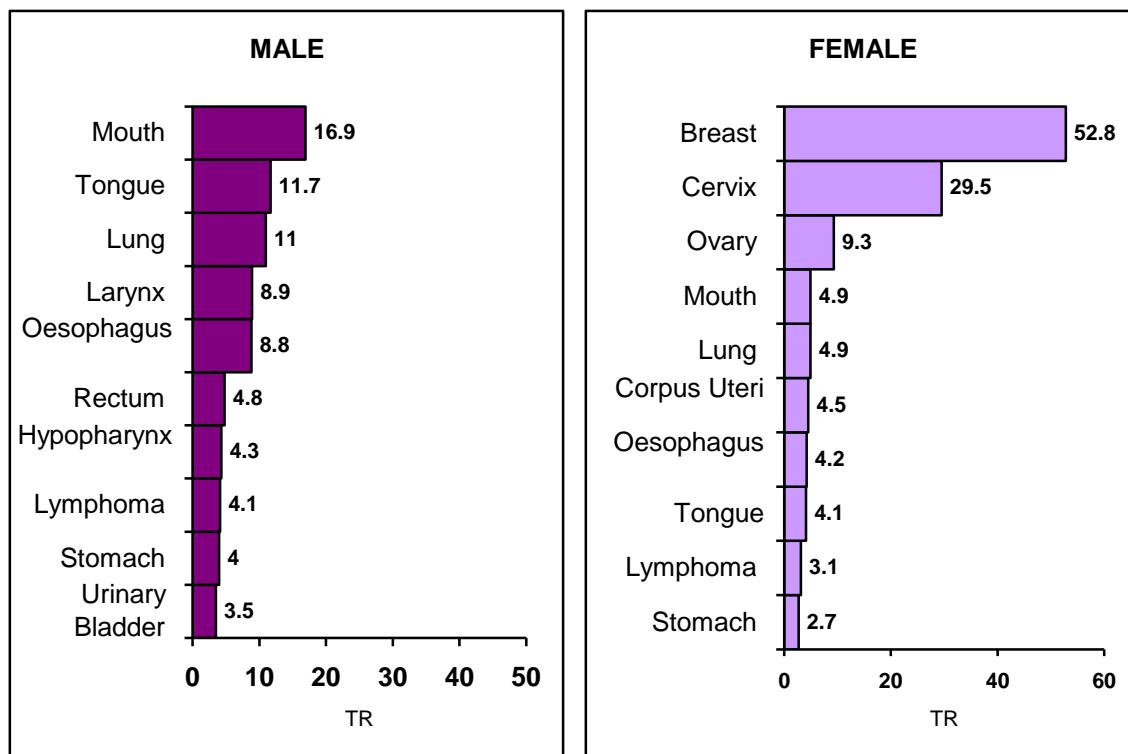

Fig.6: Truncated Incidence Rates per 100,000 Population at Ten Leading Sites, 2010-2015, Aurangabad

The highest incidence by primary site in males and females age wise is presented in Table F. In children (Age < 15), both in boys and girls, Leukemia were found to be most predominant. In the young adult male population, Lymphoma, Leukemia, Brain and Mouth were more predominant. The Larynx and Lung were the leading sites in the men in the age group 55-69 and above the age of 75 years Oesophagus cancer was found to be with highest incidence. Surprisingly, in males mouth cancer was found to be the most predominated cancer in the age group 30-54. In females in the age group 25-29 years onwards cancer of the Breast was found to be with the highest incidence.

Table F: The Highest Incidence Rate by Age and Sex per 100,000 populations, 2010-2015, Aurangabad.

Age group	Male		Female	
	Site	Rate	Site	Rate
00-04	Leukemia	4.8	Leukemia	0.9
05-09	Leukemia	3.9	Leukemia	3.3
10-14	Leukemia	3.3	Leukemia	1.8
15-19	Lymphoma	2.1	Leukemia	2.0
20-24	Leukemia	2.0	Leukemia	2.4
25-29	Brain	2.7	Breast	4.6
30-34	Mouth	10.1	Breast	12.6
35-39	Mouth	13.2	Breast	18.4
40-44	Mouth	16.3	Breast	34.3
45-49	Mouth	19.4	Breast	59.3
50-54	Mouth	16.8	Breast	64.1
55-59	Larynx	21.9	Breast	74.0
60-64	Lung	26.8	Breast	87.2
65-69	Lung	55.4	Breast	81.7
70-74	Lung	70.5	Breast	58.1
75+	Oesophagus	36.6	Breast	35.3
All Ages	Mouth	7.1	Breast	18.2

Method of Diagnosis

An evaluation of the reliability of cancer data is usually measured by the percentage of patients having microscopic proof of diagnosis as compared with other methods, which are considered less accurate. Incidence cases of cancer by site, sex and method of diagnosis are presented in Tables 20 & 21 for males and females separately. The percentage of new cancer cases diagnosed by method of diagnosis and sex is presented in Table G. During the period of 2010-2015, 94% of the new cases recorded had microscopic confirmation of cancer. The percentage of patients diagnosed on the basis of clinical investigation was of 0.8% (Fig.7)

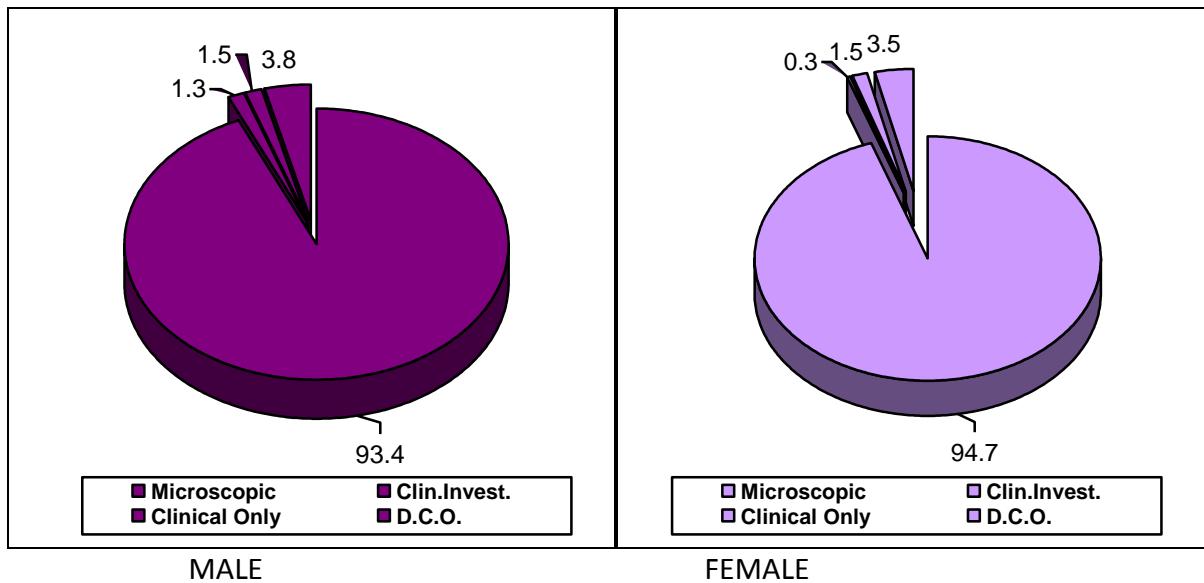

Fig.7: Percentage Distribution of the Incidence cases of Cancer by Method of Diagnosis, 2010-2015

Table G: The Percentage of New Cancer cases by Method of Diagnosis, 2010-2015, Aurangabad.

Method Of Diagnosis	Male		Female		Total	
	N	%	N	%	N	%
Microscopic	1917	93.4	2023	94.7	3940	94.0
Clinical Investigation	26	1.3	7	0.3	33	0.8
Clinical Only	31	1.5	33	1.5	64	1.5
DCO	79	3.8	74	3.5	153	3.7
Total	2053	100	2137	100	4190	100

Mother Tongue

Vast differences have been known to exist in the habits and customs of different section of the large and complex Hindu community in India. One of the ways of identifying the different groups is on the basis of the written and spoken language. Indian states have been organized primarily on linguistic basis and the mother tongue provides an important source of information, to study the variations found in the relative frequency of cancer.

Incidence cases of cancer by language and site with percentages are presented in 24 & 25 for males and females respectively.

The site incidence patterns exhibit considerable differences in the various linguistic sections. The five most common sites in each linguistic group by sex are presented in Table H.

Table H: Five Most Common Sites of Cancer in different Linguistic Groups by Sex, Aurangabad, 2010-2015.

Language	Male			Female		
	NO	Site	%	NO	Site	%
Marathi	1	Mouth	13.3	1	Breast	30.2
	2	Tongue	9.1	2	Cervix	21.9
	3	Lung	9.0	3	Ovary	4.8
	4	Oesophagus	8.5	4	Oesophagus	4.3
	5	Larynx	6.0	5	Lung	3.9
Urdu						
	1	Lung	15.0	1	Breast	35.6
	2	Mouth	14.2	2	Cervix	14.0
	3	Tongue	9.3	3	Ovary	7.6
	4	Leukemia	9.1	4	Leukemia	5.2
Hindi						
	1	Mouth	16.3	1	Breast	34.2
	2	Lung	10.9	2	Cervix	11.4
	3	Tongue	8.0	3	Ovary	6.8
	4	Leukemia	7.6	4	Lymphoma	4.6
	5	Larynx	5.8	5	Leukemia	3.8

From the Table H, it has been observed that in males, the Mouth in Marathi speaking and Hindi speaking, and the Lung in Urdu speaking ranks first site where as in females Breast ranks first in Marathi, Urdu and Hindi speaking.

Marital Status

An increasing incidence and mortality of cancer relevant to the marital status have been reported in several articles during the past 30 years. In particular, attention has been focused on the relation of marital status to the morbidity and mortality of cancers of the female breast and reproductive organs. Marital Status is one of the major variables included in many epidemiological studies relating to such cancers. The number and the percentage distribution of cancer cases by marital status and site are presented in Table 26 & 27 for Males and Females respectively.

Education

In the preceding pages, consideration has been given to examine the variation in cancer incidence that can be attributed to religion, the mother tongue and the marital status. These demographic variables are not very sensitive for determining the variations attributable to socioeconomic status. In the Indian situation, evaluation of the socioeconomic status is a very complex matter and there is no simple way of classifying the different groups that exist in the region under study.

Innumerable castes and tribes make its futile exercise to provide any meaningful grouping. Family income is a useful criteria but in a hospital setting where the fees chargeable are often assessed on this information, it is not possible to obtain reliable data. Under these circumstances, the level of formal education provides a more appropriate measure of the socio-economic status. We have tried to obtain information on the educational level of each cancer patient. Unfortunately, for a large number of patients we could not obtain this information from the hospital records. Only when we were able to interview the patients individually, was it possible to obtain this data.

Incidence cases of cancer by education and site with percentages are given in Table 28 & 29 for males and females respectively.

In general we can conclude from the Table I that Lung, Pharyngeal, Tongue and Laryngeal Cancers which are known to be associated with tobacco-chewing and Cigarettes and bidi smoking habits are more prevalent in the lower socio-economic group.

Table I: Percentage Distribution of Cancer Cases for Selected Sites by Educational Level. Aurangabad, Males, 2010-2015.

Site	Illiterate	Prim + Mid	Sec + Tech	Coll.& Above
Tongue	5.7	7.6	9.5	16.8
Mouth	7.2	13.0	11.5	23.7
Oropharynx	2.4	2.2	1.6	0.3
Hypopharynx	3.9	3.9	3.2	1.9
Larynx	7.8	6.2	8.1	1.6
Lung	10.8	11.4	9.5	4.7
Oesophagus	6.6	8.6	6.3	5.7
Stomach	3.6	2.8	3.8	3.2

In females, besides the breast and uterine cervix, cancer of the buccal cavity and pharynx are the most commonly affected sites. These three sites group are examined in detail in relation to education levels in Table J and Fig. 8.

Table J: Percentage Distribution of Cancer Cases for Selected Sites by Educational Level, Aurangabad, Female, 2010-2015.

Site	Illiterate	Prim + Mid	Sec + Tech	Coll. & Above
Mouth	3.5	2.5	2.5	4.2
Breast	23.0	32.7	36.3	33.5
Cervix	21.1	17.9	20.3	18.9

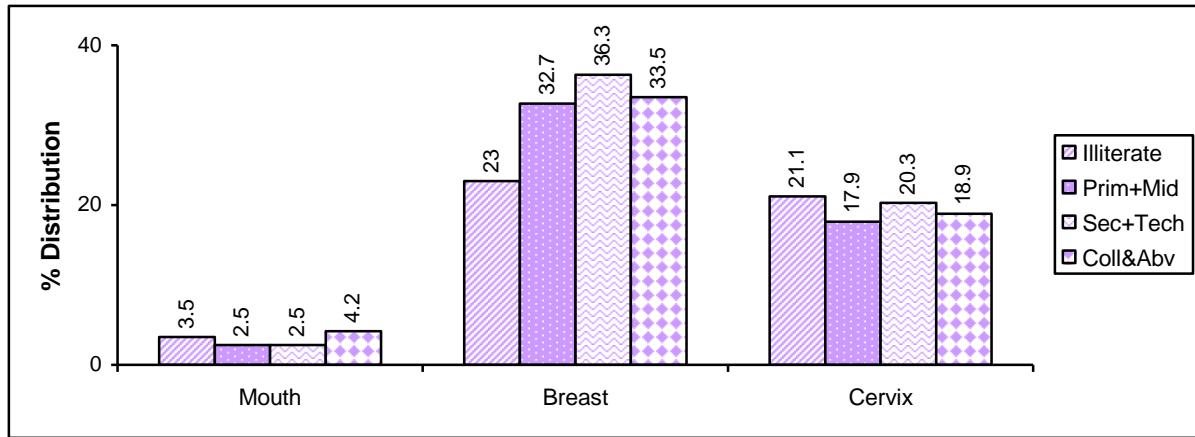

Fig. 8: Percentage Distribution of Cancer Cases for Mouth, Breast, Cervix by Educational Level, Female, Aurangabad, 2010-2015.

Histology

During the period 2010-2015, 3940 cancer cases were confirmed microscopically. The proportion of histopathologically proved cases was found to be 94.0%. The proportion of histopathologically confirmed cases was a little higher for females (94.7%) as compared to that for male (93.4%). The various histological varieties observed for all sites together during 2010-2015 by sex with percentage distribution is presented in Table 30.

Tobacco Related Cancers

Sites of cancers that have been associated with the use of tobacco include lip, tongue, oral cavity, pharynx, oesophagus, larynx, lung and urinary bladder. The proportions of these sites of cancer to all sites in males and females are given in Table K. In males this proportions is 55.0% while in females it is 16.8%. Lung, Oesophagus and oral cavity are major contributors of tobacco related cancers.

Table K: Number (N) & Proportion (%) of specific sites of cancer related to use of Tobacco related to all sites of cancers, Aurangabad, 2010-2015

Site	Male		Female	
	N	%	N	%

Childhood Cancers

Cancers in childhood constitutes one of the most important groups of tumours, not only because of the age occurrence implying different set of etiological factors from those commonly seen in adult cancers, but also because in the past 2-3 decades, with advances particularly in chemotherapy, many of the childhood cancers have gained markabley high potency for care. The proportion of childhood cancers related to all sites of cancers is 4.4% in boys 2.3 % in girls. The number and relative proportion of broad types of childhood cancers are given in Table L. Leukemias and lymphomas, constitutes the vast majority of Childhood cancers.

Table L: Number (N) & Proportion (%) of specific types of cancer in Childhood, Aurangabad, 2010-2015

Site	Boys		Girls	
	N	%	N	%
Leukemia	46	50.5	20	40.0

Cancer in Young Adults (15-34 years):

Cancer in young adults i.e. between the agegroup of 15-34 is one of the most important strata of the population. Mouth cancer and Breast cancer are the leadings cancer among male and female respectively. The proportion of young adults to all agegroup is 12% and 11% in male and females respectively.

Table M: Number (N) & Proportion (%) of types of cancer in Young Adults, Aurangabad 2010-15

Cumulative Incidence Rate

The cumulative incidence rate is simply a summary measure of the experience of a population over a longer time span or age interval. It is obtained by summing up the age specific incidences for each year in the defined age interval. The cumulative incidence is a directly standardised incidence rate and a good approximation to the actuarial or cumulative risk. The age cumulative incidence rates (00-74 years) are calculated for all sites in both the sex (Table N). On an average 1 out of 13 males and 1 out of 12 females are at risk of developing cancer in his/her lifetime (00-74). In males, 1 in 98 and 1 in 119 will be at risk of developing lung and mouth cancer respectively. While in females, 1 in 40 and 1 in 61 will be at risk of developing breast and cervix cancer respectively.

Table N: Cumulative Rate (%) and Life Time Risk of developing cancer to age 74 years by Site and Sex, Aurangabad 2010-15 (1 in : Risk of Developing cancer)

Appendix:

Calculation of Rates

Age Specific Rates are calculated by dividing the number of cases in each 5 year age and sex stratum by corresponding population estimates for that stratum and multiplying the product by 100,000 to give the rates per 100,000.

Crude Rates are calculated by same way using the total cancer cases and total cases and total population by sex.

Age-Adjusted Rates are calculated by summing the products of the age specific rates and the world standard population strata. They provide a rate which is independent of the age structure of the population of interest and are therefore useful in making comparisons between different populations, time periods etc.

Cumulative Rates are calculated by multiplying the five year age specific rates per persons by 5 ad summing over age groups from 0-4 to 70-74. This rate is then expressed as a percentage. This rate is good indicator of life time risk.
